No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 5750345
FILING DATE: 10-JUN-1994
CLASSIFICATION:
INFORMATION FOR SEQ ID NO: 1:
SEQUENCE CHARACTERISTICS:
LENGTH: 1666 base pairs
TYPE: nucleic acid
STRANDEDNESS: single
TOPOLOGY: linear
MOLECULE TYPE: DNA (Genomic)
HYPOTHETICAL:
                                                                                                                                                                                                                                                                                                   ORGANISM: Homo Sapiens
CELL TYPE: Beta-globin gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        NAME/KEY: misc_signal

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

http://CCR-081.mit.edu/GENSCAN.html), GeneMarkHMM (Mark Borodovsky, http://genemark.biology.gatech.edu/GeneMark/), GlimmerA (a variant of GilmmerM, see Mihaela Pertea all GeneMark/), GlimmerA (a variant http://www.tigr.org/softlab/glimmerm.htm/glimmerm.html, and GeneSplicer (Mihaela Pertea and Steven Salzberg, contact mpertea@tigr.org), searches of the complete sequence against a peptide database and the plant EST database at TIGR (http://www.tigr.org/cdb/cdb/glishtml). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity, are named as unknown proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as hypothetical proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wistl.edu/eddy/tRNAscan-SE (Sean Eddy, http://genome.wistl.edu/eddy/tRNAscan-SE (Sean Eddy, http://genome.washington.edu/RN/Repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RN/Repeatmasker.html).

An Arabidopsis full-length cDNA library was constructed essentially
as reported previously (Seki et al. (1998) Plant J. 18:707-720;
Seki et al. (2002) Science 296:141-145), cDNA claeved with BamHI
and XhoI was ligated to modified lambda FLC-1-E vector (Carninci et
al. (2001) Genomics 77:79-30) digested with BamHI and SalI.
This clone is in a modified pBluescript vector.

Genes with aimilarity to proceins in the databases are described in 'product' or 'note' qualifiers. Genes that have no significant protein similarity to proceins in the databases are described in 'product' or 'note' qualifiers. Genes that have no significant protein similarity are described as 'unknown protein.'
The software programs used to predict genes include: Grail (Informatics Group, Oak Ridge National Laboratory).

Submitted (11-MAX-2002) Ceres, Inc, 3007 Malibu Canyon Road, Malibu, CA 90265, USA

This clone sequence is one of 5,000 Ceres full-length cDMAs made available to TIGR and Genbank. The following quality assessment of this set was done by comparison with known proteins: two percent of the clones are estimated to be 5'-truncated; less than one percent are 3'-truncated; approximately two percent alternative splice variants, including unspliced introns and spliced exons; one percent may contain premature stop codons; five percent may have frame shifts in a coding region. A sequence is considered to be 5'-truncated if it lacks the translation initiation start (ATG). A sequence is considered to be 3'-truncated if it lacks the C-terminal end of the encoded protein. Please note that these CDNA sequences are derived from the Ws or Laker cootypes and therefore
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /trānslation="MLMKQEDGYLQPVKTKPAPKRPTSKDRHTKVEGRGRRIRMPAGC

Genset carried out the library production and sequencing of the full-length clones. Ceres, Inc. carried out the clustering of the 5' sequences, selection of clones, and sequence assembly.
